Building is not the same as being right.

Separate the work from the decision
that it is ready to ship.

Two boundaries. Four responsibilities.

01

Observe

Permitted evidence only.

→

02

Specify

Requirements. Knowns and unknowns.

→

03

Build

Implement from the approved brief.

→

04

Verify

Compare with the request and the spec.

Information boundary: what the builder receives.
Release boundary: what evidence allows the result to advance.

CONCRETE REFERENCE

Craft Anything makes the pattern tangible.

What its documentation describes

Study → Build → Check → Ready

Default clean-room mode uses visible observations, not original code or page source.

What we should not claim

Not a verified two-team firewall.
Not a legal clearance service.

Early-alpha software. Tool restrictions are not an operating-system sandbox.

Documented example, not a benchmark we ran. Craft Anything: workflow & limits · Agent permission boundaries

The missing requirement must stop the handoff.

A small teaching fixture can use a page we own and a required contact/help link.

Required link missing	Request changes
Evidence missing or stale	Block
Contract checks pass	Eligible for review

A static check proves only that contract check. Browser behavior and permission to publish remain separate.

We already use related practices. Now make the gates explicit.

Spec before interpretation.

Evidence before acceptance.

Permission before publication.

Our website workflow already separates staged changes, integration, and independent browser checks. That is a related practice, not universal enforcement.

Member pack: briefing, reusable skill, prompts and runnable fixture. Open the Founding Circle materials
