Command Center

A read-first view of fulfillment, revenue, and meeting context—so the commander can see what is happening without opening five systems.

Design brief · 2026-11-05 · Requested in the mastermind session (segments 564–587)

> **Not a claim of live integration.**
> This document defines the first version, its fields, and its review gates. Connector access and owner names must be verified before implementation.

Three contexts, one view

Fulfillment
Active services, owners, stage, latest evidence, and outcome signal.

Revenue
Last/next billing, amount, payment channel, collection state, and exceptions.

Meeting
Last/next meeting, transcript, disposition, sentiment, and missed-meeting signal.

Commander view
One source of truth with timestamped evidence and visible unknowns.

First principle

Unknown is a valid state. A blank connector or missing evidence is not a healthy status.

Know what each client is receiving.

Start with active services and ownership. Add performance only when the source and timestamp are visible.

Initial service buckets

SEO implementation
Skills, status, evidence, outcome.

Web implementation
Build and delivery stage.

PPC / paid media
Campaign state and result signal.

Meta ads / local
Active scope and performance source.

Minimum record

FIELD	QUESTION ANSWERED	SOURCE TO VERIFY
Client + active services	What are we responsible for?	CRM / GHL tags
Owner + current stage	Who is accountable and where is it?	Team roster / service system
Latest evidence	What proves the state?	Dashboard / report / artifact
Outcome signal	Is the work producing the intended result?	GA4 / SearchAtlas / service dashboard
Blocker	What needs a decision?	Lane board

Acceptance gate

Enumerate active clients, show their active services, give each service one owner, and link to evidence. Do not infer health from missing data.

Make the exceptions visible.

Revenue context

Show last and next billing, amount, payment channel, collection state, and mismatches between delivery and billing.

FIELD	SOURCE
Last / next invoice	FreshBooks
Amount + channel	FreshBooks
Collection state	FreshBooks
Exception	Command-center rule

Read-only first. No charge, refund, or billing change is implied.

Meeting context

Know when the client was met, what was decided, what comes next, and whether the expected meeting happened.

FIELD	SOURCE
Last / next meeting	Zoom / calendar
Transcript + disposition	Zoom + grading skill
Sentiment signal	Transcript / email analysis
Missed meeting	Schedule vs. occurrence

Identity matching and API scopes come before automation.

Implementation sequence

1. Prove a real read-only Zoom fetch and source identity.
2. Store private meeting metadata and transcripts with revision keys.
3. Add disposition and next-meeting checks.
4. Add sentiment only after the first layers are reliable.
5. Review the first view with the named owners before any external write.

> **Owners named in the session:** Fulfillment — Jessica · Revenue — Brandon · Meeting — Jonathan. Verify before implementation.
